# Fused Fibre Optic Light Leads

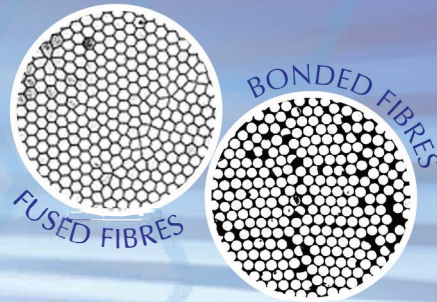

A stainless steel armour spiral protects the fused fibres from breakage during normal use. Glass silk braiding protects the cable from stretching. Finally the cable is encased in a silicon sheath making a completely sealed unit.

Fused light leads have far less light loss as each fibre is compressed to meet its neighbour. Unlike the more conventional bonded cables, no organic cement is needed to fill the gaps between the fibres. This dramatically reduces the chance of the cables burning at the light source end, making them ideal for use with high intensity and Xenon light sources.

Standard lengths of 1800mm, 2300mm and 3000mm with diameters of 3.5mm and 4.8mm are available from stock. Other lengths of cable and diameters can be made to order.

All cables are individually serial numbered for traceability, CE marked and fully autoclaveable.

Cables are fitted with standard adaptors at both the light entrance and light exit ends, to suit machine and telescope requirements. Choose from a wide range of adaptors to suit all surgical needs.\* Stock adaptors include Aerni/British Standard, Wolf, Storz & Olympus.

We are 100% confident that you will be so impressed with the superior light output of our cables compared to others on the market that should you not be completely satisfied we will be happy for you to return our cable for a full refund.\*\*

With the key points below we believe you can't fail to be impressed.

- **Pure brilliant light output**
- **Serial numbered for traceability**
- **Fully autoclaveable**
- **8 different sleeve colours**
- **Prices include light entrance/exit adaptors\***
- **Various cable lengths available**
- **Various bundle diameters available**
- **CE marked**
- **Adaptors to suit all surgical needs**
- **Highly competitive prices**
- **Full money back guarantee**
